Toufic Hanna

FULL-STACK DEVELOPER · JAVA / SPRING · REACT

Full-Stack Developer with 2.5+ years of professional experience building secure, multi-tenant web applications. Specialized in Java/Spring backends and React frontends, with a strong focus on authentication (MFA, SAML/SSO), API design, and application security. Currently sole developer on the replacement of a legacy desktop product with a web platform — from specification to implementation. Runs personal infrastructure on Oracle Cloud with Docker.

EXPERIENCE

Full-Stack Developer

Jan 2024 – Present

LITTERA Software & Consulting · Hall in Tirol, Austria

- Sole developer on the replacement of a long-established Windows desktop product with a web application — a learning-materials management system used by schools in Germany. Responsible for development end-to-end since Jan 2026: deriving work packages and estimates directly from the specification and rebuilding the product's full functional range (catalogue, lending, school structure and school-year administration, requirement planning) in Java/Spring and React, with review and QA by colleagues.
- Diagnosed and resolved a timeout exception on large deliveries (200+ items) by identifying over-fetching — the query retrieved full objects instead of the required attribute. Optimized the query, eliminating the timeout entirely.
- Implemented Multi-Factor Authentication (TOTP) with Spring Security and SAML-based Single Sign-On with external partners, strengthening account security across the platform.
- Built a licence overview for the internal support tool — staff can filter across all client institutions by licence attributes (number of copies, active/inactive, licence type) instead of looking the data up manually in the database.
- Built a bulk lending-session close feature in React, allowing staff to close all active sessions in one action. Receipts are handled automatically per institution's tenant configuration — emailed, printed, or skipped — reducing manual end-of-day work.
- Implemented batch cataloguing for the library management app — staff can enter multiple ISBN-13s to catalogue several books at once. Widely requested by clients migrating from the legacy system to the new web application.
- Engineered a library acquisition module with Excel import, offer management, and supplier API integration, plus a REST integration for transactional email delivery and a Spring-based password-reset flow.
- Implemented autocomplete search powered by Solr and a reusable Drupal dropdown filtering module.
- Mentored a junior intern through onboarding, code reviews, and technical guidance.

Software Development · Project Collaboration

Mar – Sep 2023

Independent project team · Syria

- Sole developer of an interactive Gantt scheduling module built with dhtmlxGantt in plain PHP (no framework), intended for integration into a workflow and project management product for business customers. Built over six months within a three-person team.

PERSONAL PROJECTS

Self-Hosted Vaultwarden

Deployed a Bitwarden-compatible password manager on Oracle Cloud using Docker. Configured reverse proxy, SSL, and persistent storage.

Docker Oracle Cloud Linux Self-Hosting

Portfolio Website

Designed and built a personal portfolio site, self-hosted on Oracle Cloud. Deployment and server configuration managed independently.

Astro Docker Oracle Cloud

EDUCATION

B.Sc. Software Engineering & Information Systems

2016 – 2022

Tishreen University · Syria · Focus: Databases, Networks & Software Development

INTERESTS

AI & emerging technologies · Cybersecurity & ethical hacking · Self-hosting & homelabs
